

Post Anesthetic Patient in Phase 1, Care of

Site Applicability

VGH & UBCH PACU

Practice Level

RN: Advanced Skill

Policy Statements

1. All patients admitted to PACU will have airway patency, respirations, SpO₂, pulse, blood pressure, depth of consciousness, sedation score, pain level, muscle tone and temperature assessed as per the [TABLE: Assessment Parameters and Frequency](#) below. Other parameters (e.g., surgical, neurological, hemodynamic, and ventilator) will be assessed and monitored as applicable to the individual patient as per the [TABLE](#) below.
2. RNs are responsible for monitoring and documenting assessment parameters at intervals specified in the [TABLE](#) below and for increasing the frequency and scope of assessments as required by changes in the patient's condition.
3. Monitor alarms remain ON for the entire duration of the patient's stay in PACU whether or not discharge criteria have been met – **NO EXCEPTIONS.**

Protocol

Practice Guideline

Assessment

On admission to PACU:

1. Assess for symptoms of upper and/or lower airway obstruction by tracheal & lung auscultation and observation:
 - Absent or decreased breath sounds
 - Adventitious sounds, e.g., gurgling, snoring, stridor, wheezing, crackles
 - Dyspnea, e.g. nasal flaring, tracheal tug, indrawing, restlessness, increased abdominal movement
 - Persistent coughing or gagging

IMMEDIATELY INTERVENE IF AIRWAY OBSTRUCTION IS PRESENT!!!

2. Assess for presence, site, position and patency of artificial airways.
3. Assess baseline respiratory status including:
 - Rate, depth, ease & regularity of respirations
 - Symmetry of chest expansion
 - System & amount of supplemental oxygen
 - Peripheral & central skin colour
 - Arterial oxygen saturation
4. Initiate ECG monitoring and assess rate, rhythm and for evidence of ischaemia as applicable.
 - [see ECG Monitoring in PAR \[D-00-12-30305\]](#).
5. Assess blood pressure, avoiding arm with AV fistula in situ, operative arm or arm on same side as mastectomy with axillary lymph node resection.

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. It is not a substitute for proper training, experience and the exercise of professional judgment. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

6. Assess other circulatory parameters as applicable to the patient, e.g., CVP, peripheral perfusion.
7. Assess depth of consciousness and sedation.

VGHC PACU/PCC	UBCH PACU/SDC
Assess depth of consciousness: <ul style="list-style-type: none"> • UNCONSCIOUS – no response to stimulation • REACTING – non-purposeful movement to stimulation • RESPONDING – obeys simple commands, not oriented • CONSCIOUS – oriented to person, place & time 	To assess Level of Consciousness/Sedation: <ul style="list-style-type: none"> • A score key is used which combines level of consciousness with sedation (See Appendix A-2) • 2 = Conscious, opens eyes, easy to arouse • 1 = Frequently drowsy, easy to arouse • 0 = Unresponsive or somnolent
Assess Sedation Score when patient is conscious using Passero Opioid Induced Sedation Score - POSS (See Appendix A-1)	

8. Assess muscle tone, e.g., ability to sustain head lift, extremity strength & movement.
9. Assess temperature:
 - Temporal artery temperature (TAT) using temporal artery thermometer or oral temperature with IVAC thermometer if temporal site inaccessible
10. Assess motor & sensory level of regional anesthesia:
 - Spinal/epidural sensory dermatome levels will be determined by testing with ICE, starting from the lower or blocked area. The dermatome documented is the first area where the patient feels a cold sensation.
 - Verify the patient's ability to independently turn side to side for airway protection prior to discharge.
11. Assess nerve-specific motor/sensory function as applicable for upper and lower extremity peripheral nerve blocks (See [Appendix B](#))
12. Assess surgical parameters including:
 - IV site, catheter, solution, amount & rate
 - Site & condition of dressings, incision lines
 - Site of & returns from drains & catheters in situ
 - Surgery specific parameters, e.g., neurovascular status, NVS, ostomy condition, traction, etc
13. Assess for risks to comfort & safety:
 - Pain level
 - Sedation score
 - Positioning/body alignment
 - Disorientation/agitation
 - Skin integrity

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

- Lumbar puncture/epidural/PNB site (as applicable)
- Nausea & vomiting
- Shivering
- Bladder distention
- Presence or use of **restraints**
 - CSMW & skin integrity of restrained limbs Q1H
 - resolution or escalation of behaviours requiring restraint application Q15 minutes

14. Calf compressors

- appropriate fit/application/settings
- patient comfort, evidence of motor, sensory or circulatory abnormality

15. Assess information obtained from Anaesthesiologist, OR team and patient record regarding:

- Comorbidities and other conditions impacting care requirements, e.g. substance abuse, aggressive behaviour and infectious disease precautions
- Language barrier and other special needs that may require family assistance
- Pre-operative baseline
- Pre-operative medications with special attention to medications that may be resumed in PACU i.e. cardiovascular, anti-Parkinson's, anti-glaucoma and anti-epileptic drugs.
- Intra-operative course including anaesthetic drugs, reversal agents and surgeon's notes
- Fluid balance
- Pertinent details of surgical procedure, e.g. incisions, drains in situ, implants, prosthetics
- Anaesthesia orders including goal hemodynamic parameters
- Surgical orders

16. Confirm with OR RN

- Patient identification by verifying name, date of birth and MRN with patient ID band & face sheet
 - If ID band Not in situ, OR RN must provide new one
- Allergy band in situ & information accurate (as applicable)

17. Assess readiness for discharge using discharge criteria.

Interventions

1. Notify anaesthesiologist if:

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. It is not a substitute for proper training, experience and the exercise of professional judgment. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

- Persistent airway obstruction not responsive to nursing intervention (e.g. jaw thrust, Stir-Up)
- Dyspnea
- Significant desaturation (SpO₂ is < 90%) or hypoventilation
- Significant arrhythmias
- Systolic BP is 20% above or below preop baseline and/or patient is symptomatic, e.g., symptoms of ischaemia, alterations in LOC Symptoms of local anaesthetic toxicity, e.g., confusion, agitation, tinnitus are present
- Cephalad progression of motor/sensory level
- Uncontrolled nausea/vomiting or pain
- Unexpected hypothermia or hyperthermia
- Abnormal lab results
- 2. **Notify surgeon** if surgical parameters deteriorate
- 3. **Ensure airway patency:**
 - Position for airway protection
 - flat and on side (unless contraindicated by surgical procedure) if evidence of obstruction in supine position on side if experiencing nausea or vomiting
 - Ensure anterior mandibular displacement via chin lift/head tilt or jaw thrust as required
 - Insert oral or nasal airway prn
 - Suction prn
 - Assist patient to deep breathe and cough as required
 - **Ensure appropriate emergency equipment is at the bedside, e.g., wire cutters, back-up tracheostomy supplies, suture removal set**
- 4. Initiate and maintain oxygen therapy as per anaesthesia orders.
 - Apply oxygen for shivering or Temp < 36.0°C.
- 5. Minimize heat loss and/or actively **warm patients** if Temperature is < 36.0°C.
 - Discontinue active warming when T > 36.0°C
- 6. **Stir patient up** Q10 to 15 minutes (unless contraindicated by surgery or anaesthetic technique):
 - 2 to 3 deep breaths using sustained maximal inhalation or incentive spirometry device
 - coughing if secretions present
 - flex/extend extremities
 - progressively elevate HOB as tolerated by
 - blood pressure
 - assess for and relieve pain

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. It is not a substitute for proper training, experience and the exercise of professional judgment. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

7. **Turn** patient side to side Q2 hours and prn (unless contraindicated by surgical procedure or VS instability).
8. Implement measures to **manage pain** including analgesics as ordered, positioning, support of operative site, ice packs, etc.
9. Manage **PONV**:
 - position on side until nausea resolved
 - administer antiemetics as ordered
10. **Re-orient** patient to person, place and time at frequent intervals as required
11. Protect insensate limbs (following spinal anaesthesia, nerve block) from injury:
 - Position & support limbs in correct alignment
 - Ensure adequate padding around bony prominences
 - Limit heat or cold application to maximum 15 minutes and check site after removal to verify skin integrity
12. Implement **comfort** and **safety** measures:
 - Skin and mouth care
 - Cover with warmed blankets
 - Remove wet or soiled linen
 - Ensure bed linen free of wrinkles
 - Ensure limbs in good alignment and protected from pressure
 - Ensure side rails up and brakes locked
 - Secure all tubes and catheters
13. Implement anaesthesia and surgical orders
14. Resume administration of key time sensitive (cardiovascular, anti-Parkinson's, anti-glaucoma and anti-epileptic) pre-operative medications in PACU in the following circumstances:
 - The medication has been reordered
 - The patient is stable and can tolerate oral medications
 - The specific condition is not being actively treated with an IV medication (e.g. receiving Labetolol for hypertension)
 - The patient requires an extended stay (> 4 hours) in PACU

UBCH: FAX copy of inpatient orders to Pharmacy between 0800-2100, Monday to Friday

15. Follow PACU discharge procedure to discharge patient when ready.

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

UBCH:

When a PACU patient requires transfer to another area direct from PACU for a test/procedure, the PACU RN will collaborate with all staff to ensure that the patient receives appropriate care while still allowing the procedure to be completed. The Anaesthesiologist caring for the patient will remain responsible for the patient if discharge criteria have not been met:

1. **When Discharge Criteria Not Met**
 - a. **Non-urgent test/procedure**
 - Attempt to delay test/procedure until patient meets PACU discharge criteria
 - b. **Urgent or STAT test/procedure (e.g. CT Scan, treatment at BCCA)**
 - PACU RN must accompany the patient to the test/procedure and remain with the patient throughout the test/procedure, providing required nursing care. The PACU RN will return to PACU with the patient following the test/procedure and will continue to care for the patient until PACU Discharge Criteria are met.
2. **Discharge Criteria Met & Patient going Directly to Test/Procedural Area**
 - a. If the patient is going direct from PACU to the test/procedure area and will require nursing care during the test/procedure, the PACU RN will communicate with the ward to determine who will accompany and care for the patient. If the ward is unable to provide an RN, the PACU RN will accompany the patient.

Patient Education

Implement patient education as required in the following areas:

- Purpose of oxygen therapy
- **Regional Anaesthesia:**
 - Return of motor function before sensation
 - **Experiences associated with return of sensory function, e.g., “tingling”, buzzing”, temperature changes**
 - Estimated duration of block
 - Activity restrictions (e.g., minimum one person to assist with ambulation or use of appropriate ambulation aid following femoral nerve block, avoid prolonged heat/cold application, maintain alignment, protected limb positioning)
- Rationale for stir-up
- Interventions to manage problems/complications
- Anticipated discharge time
- Post-discharge care

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. Please do not distribute this document outside of VCHA without the approval of the VCH Office of Professional Practice.

Evaluation (Guideline Only)

Patient meets the Discharge Criteria.

Documentation

Document initial and ongoing assessments & interventions including VS, LOC, sensory/motor level, surgical parameters, medications given, complications/problems experienced and patient outcomes as follows.

- If restraints are initiated or in situ, document behaviour(s) requiring restraint application, type of restraint used, time of application & removal and first name/last initial of person applying and/or removing restraints.

Appendix A-1

VGH Sedation Score

VGH PACU SEDATION SCORE (Derived from PASERO Opioid-Induced Sedation Scale – POSS)	
SCORE	DEFINITION
S	Sleep, easy to rouse
1	Awake and alert
2	Slightly drowsy, easily roused
3	Frequently drowsy but rousable, drifts off to sleep during conversation
4	Somnolent, minimal or no response to verbal & physical stimulation (use trapezius muscle squeeze for physical stimulation – DO NOT use sternal rub)

NOTE: This is a controlled document. A printed copy may not reflect the current, electronic version on the VCH Intranet. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version. This CPD has been prepared as a guide to assist and support practice for staff working at Vancouver Acute. It is not a substitute for proper training, experience and the exercise of professional judgment. Appendix A-2

UBCH Level of Consciousness/Sedation Score

Discharge of Phase 2/3 Ambulatory Surgical Patients SCORE KEY

Note: If "Activity" equal to Preop, or expected due to OR/Anesthesia, the patient may be given full score (e.g. quadriplegia, after knee surgery)

PARAMETER	SCORE	CRITERIA
LEVEL OF CONSCIOUSNESS / SEDATION	2	Conscious, opens eyes, easy to arouse
	1	Frequently drowsy, easy to arouse
	0	Unresponsive or somnolent
CIRCULATION BP & P	2	Within 20% of pre-op
	1	20% to 40% of pre-op
	0	> 40% of pre-op
RESPIRATION	2	Able to deep breathe
	1	Limited breathing (e.g. obstructed, shallow)
	0	Requires airway support
OXYGEN SATURATION	2	= or > 94% on room air
	1	= or > 94% on O2
	0	< 94%
ACTIVITY ***	2	Steady gait
	1	Moves some extremities, not ready to walk, able to turn to side
	0	No gross body movement
PONV	2	Controlled, acceptable to patient or maximal treatment given
	1	Further treatment required
	0	Uncontrolled after treatment
PAIN	2	Controlled, acceptable to patient or maximal treatment given
	1	Further treatment required
	0	Uncontrolled after treatment
BLEEDING	2	Minimal, no evidence of active or unexpected bleeding
	1	Operative site wet, bleeding/hematoma not increasing
	0	Increasing bleeding/hematoma

Note: This is a **controlled** document for VCH internal use. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version.

Appendix B: Assessment and Care following Peripheral Nerve Blocks in PACU

Policy

1. Block parameters as detailed in Tables 1 & 2 will be assessed:
 - On admission then
 - Q 15 to 30 minutes at the discretion of the RN and considering
 - overall stability of VS & surgical parameters
 - pain control
 - expected block duration
 - Q1H when discharge criteria met
2. The Neurovascular Record ([VCH.VA.0038](#) and [VCH.VA.0039](#)) will be used to document motor & sensory function of upper & lower extremity blocks.
3. Continuous peripheral nerve blocks will be managed as per [CPD P-100: Continuous Peripheral Nerve Block \(CPNB\): Nursing Management of the Patient](#).

Need to Know

Peripheral nerve blocks may target a defined nerve or group of nerves (plexus) or a non-specific network of nerves. Nerve blocks may be delivered as a single, “one shot” injection of local anaesthetic to the target area, as a continuous infusion or may be a combination of both.

The majority of blocks for the upper extremity target the brachial plexus at various levels and include interscalene, supraclavicular, infraclavicular and axillary blocks (see [Figure 1](#)). Femoral and sciatic nerve blocks are the most common blocks for lower extremity procedures. In order to block the majority of the lower extremity, 2 blocks (femoral & sciatic) must be performed (see [Figure 2](#)). The innervations of the obturator, lateral femoral cutaneous, and posterior femoral cutaneous nerves must also be considered.

In some cases, the block may be supplemented with an additional cutaneous nerve block, for example, the brachial plexus nerve block with adjunctive intercosto-brachial nerve block, sciatic nerve block with saphenous nerve block.

Block duration and intensity varies depending on a number of factors, the most important being the local anesthetic agent used. Dose, concentration, volume of the selected local anaesthetic, adjunctive medication such as epinephrine and the type of block used also affect the duration. Consult with the anaesthesiologist regarding expectations for block recovery.

Practice Guideline

Peripheral nerve blocks may target a defined nerve or group of nerves (plexus) or a non-specific network of nerves. Nerve blocks may be delivered as a single, “one shot” injection of local anaesthetic to the target area, as a continuous infusion or may be a combination of both.

Assessments

Assess:

1. **Block parameters:**
 - Expected duration of block
 - Motor and/or sensory distribution of relevant peripheral nerves - see [Table 1](#)
 - General & specific complications associated with the block - see [Table 2](#)
2. Signs of block wearing off
 - patient will usually feel a tingling sensation in blocked area before full sensory recovery from block
3. Condition of injection site or catheter insertion site
4. Quality of analgesia related to block
5. Circumferential dressings or cast for tightness
6. Alignment and protection of insensate limbs/areas
7. Symptoms of Compartment Syndrome (as applicable – upper or lower extremity surgery)
 - Pain occurring above an adequate block
 - Abnormal peripheral circulatory parameters (pulses, colour, skin temperature)
 - Progressive swelling of affected limb
 - Underlying muscle tense/hard to palpation

Interventions

Assess:

1. Prevent injury to insensate/blocked area
 - Maintain limbs in anatomical alignment – see [Figure 4: Limb Protection Guideline](#)
 - Ensure adequate padding around bony prominences
 - Limit application of heat & cold to insensate areas to no more than 15 minutes and evaluate skin integrity prior to and after removal
 - Lower extremity block -
 - assess quad function prior to mobilizing
 - ensure use of appropriate ambulation aids – i.e. walker, crutches, or 2 person assist
 - ensure patient aware re mobilizing precautions until block resolves
2. Initiate pain management before block wears off
 - Especially important for “one shot” technique
3. Manage complications as per [Table 2](#)
4. Management of **Local Anaesthetic Systemic Toxicity (LAST)**:

SYMPTOMS	<ul style="list-style-type: none"> Suspect LAST in any patient demonstrating alteration in mental status, neurological symptoms, or CVS instability during or after local anaesthetic administration 	
	<p>CNS:</p> <ul style="list-style-type: none"> ➡ Symptoms may be subtle or absent Disorientation, agitation → muscle twitching, seizures CNS depression (drowsiness → obtundation, coma, apnea) Circumoral numbness, tinnitus, metallic taste in mouth dizziness, double vision 	<p>CVS:</p> <ul style="list-style-type: none"> ➡ May be the 1st or only indication of LAST ↑BP & HR, ventricular ectopy initially → Hypotension Bradycardia, conduction blocks, idioventricular rhythms V. tach, V. Fib
IMMEDIATE TREATMENT	<ol style="list-style-type: none"> STOP local anaesthetic Call Code Airway and ventilatory support <ul style="list-style-type: none"> Ventilate with 100% oxygen 4. ACLS as required with following adjustments AVOID vasopressin, Ca++ channel blockers, Beta blockers & Lidocaine REDUCE epinephrine dose (< 1 mcg/kgm/dose recommended) 5. Seizure Control: Midazolam preferred AVOID Propofol if CVS instability present 	
LIPID 20% EMULSION	<ol style="list-style-type: none"> BOLUS 1.5 ml/kgm (@ 100 ml)→ INFUSION – 0.25/ml/kgm/minute (@ 500 ml in 30 minutes) <ul style="list-style-type: none"> Can double infusion rate if BP restored but stays low 3. RE-BOLUS Q5 minutes if cardiovascular collapse persists 4. MAINTAIN infusion for minimum 30 minutes after VS stabilized 	
POST EVENT CARE	<ol style="list-style-type: none"> Monitor closely for minimum 12 hours for any recurring signs of LAST <ul style="list-style-type: none"> CVS depression related to local anesthetics can persist or recur after initial successful treatment 2. Continue any supportive measures required for symptom control and patient comfort. 	

Patient Education

Teach patient/family regarding:

- Typical recovery pattern from block, e.g.
 - expected duration
 - motor before sensation
 - distal before proximal
- Precautions** re heat/cold application, ambulation, proper positioning:
 - Femoral/Sciatic Blocks** – ensure patient is
 - aware re **high risk of falls** until block resolves
 - able to properly use ambulation aids as applicable
 - Upper Extremity Blocks –
 - Instruct patient to support surgical arm with unaffected arm when sling is removed (e.g. for bathing or dressing) in order to avoid injury to surgical site. This is especially important for shoulder surgeries where dislocations can occur.
- Pain management** – take prescribed analgesics
 - as soon as any sensory return is noted
 - before going to bed even if blocked area still feels numb
 - round the clock for the first 24 to 48 hours

Note: This is a **controlled** document for VCH internal use. Any documents appearing in paper form should always be checked against the electronic version prior to use. The electronic version is always the current version.
